

Dynamic Website Report

In summary, in Part B of the assignment, the static website of Part A was developed into a dynamic one; a login function using email and password was added, and there is now a different interface and different functionalities depending on whether the user is logged in as a tutor or a student. All these functionalities were added using an SQL database and the PHP language.

More specifically, the pages [studentPage.php](#) (home page), [announcement.php](#), [communication.php](#), [documents.php](#), and [homework.php](#) are the same as the pages in Part A of the assignment; that is, they are the student pages where the student views announcements, downloads documents and assignments that the tutor uploads and edits; they can also send an email and view the course home page.

Next, the pages: [indexTutor.php](#), [announcementTutor.php](#), [communicationTutor.php](#), [documentsTutor.php](#), and [homeworkTutor.php](#) are the pages to which the tutor has access.

- **indexTutor.php**

It includes the menu with links to other pages (Announcements, Communication, Course Documents, Homework) and the main content; the addition compared to the corresponding student page is the buttons at the bottom, with which the tutor can add, delete, and edit users. When the tutor clicks the **Add User** button, the webpage redirects them to the [createUserForm.php](#) page, where they fill in the fields (first name, last name, password, role, etc.), and the new user is inserted into the database and can now log in. The **Edit User** and **Delete User** buttons redirect you to the pages [editUserForm.php](#) and [deleteUserForm.php](#) respectively, where a search is first performed based on the full name, and then, if that user is found, the editing or deletion takes place.

- **announcementTutor.php**

It includes the menu with links to other pages (Announcements, Communication, Course Documents, Homework), and the main content consists of the creation, editing, and deletion of announcements by the tutor, interacting with the database where announcements are stored, updated, or deleted. The student can view these announcements on the [announcement.php](#) page. If we click the Add Announcement button, the webpage redirects us to the [AddAnnouncementForm.html](#) page, which contains a form with fields to be filled in (Subject, Content, Date). If we click Edit Announcement, we are redirected to the [EditAnnouncementForm.php](#) page, where we can edit an already existing announcement, and finally, with the Delete Announcement button, the announcement is deleted.

- **communicationTutor.php**

It includes the menu with links to other pages (Announcements, Communication, Course Documents, Homework), and the main content is the communication form, specifically a form that allows users to send an email by entering the sender's address, the subject, and the message, or alternatively to the email address

`tutor@csd.auth.test.gr`.

- **documentsTutor.php**

It includes the menu with links to other pages (Announcements, Communication, Course Documents, Homework), and the main content consists of the creation, editing, and deletion of documents by the tutor, interacting with the database where documents are stored, updated, or deleted. The student can view these documents on the `documents.php` page and download them. If we click the Add New Document button, the webpage redirects us to the `AddDocumentForm.html` page, which contains a form with fields to be filled in (Document Title, Description, File Upload), and a new document is created on the page. If we click Edit Document, we are redirected to the `EditDocumentForm.php` page, where we can edit an already existing document and refill the form to apply the changes; finally, with the Delete Document button, the document is deleted.

- **homeworkTutor.php**

It includes the menu with links to other pages (Announcements, Communication, Course Documents, Homework), and the main content consists of the creation, editing, and deletion of homework assignments by the tutor, interacting with the database where assignments are stored, updated, or deleted. The student can view these assignments on the `homework.php` page and download them. If we click the Add New Homework button, the webpage redirects us to the `AddHomeworkForm.html` page, which contains a form with fields to be filled in (Homework Title, Goals, Deliverables, Submission Date, and Upload Homework Description), and a new assignment is created/added to the page. If we click Edit Homework, we are redirected to the `EditHomeworkForm.php` page, where we can edit an already existing assignment and refill the form to apply the changes, and finally, with the Delete Homework button, the assignment is deleted.

For all these to function, a database is required where the data will be stored. This is `student4239.sql`, which consists of 4 tables:

- users: This table consists of the following elements: `id`, `firstname`, `lastname`, `email`, `password`, and `role`; specifically, it stores the users created by a tutor.
- announcements: This table consists of the following elements: `id`, `subject`, `date`, and `content`; specifically, it stores the announcements created by a tutor.

- documents: This table consists of the following elements: `id`, `title`, `description`, and `filename`; specifically, it stores the documents created by a tutor.
- assignments: This table consists of the following elements: `id`, `objectives`, `task_file`, `deliverables`, `title`, and `due_date`; it stores the assignments created by a tutor.

To connect the database with the PHP files, the `db_connect.php` file is required, and the `DataBaseConnection.php` file performs the reading and verification of users during login; initially, it searches for a user in the database via the email address, and if the user is found, it verifies the password using `password_verify`.

The `identification.php` file is the home page of our website where you enter your email and password. Using `DataBaseConnection.php`, as mentioned above, it checks whether such a combination of email and password exists in the database. If it does, the user is logged in to the appropriate page depending on their role: if they are a tutor, they are redirected to `indexTutor.php`, or if they are a student, they are redirected to `index.php`. Otherwise, if no such combination exists, access is denied.

The files `fetch.php`, `process.php`, and `handling.php` serve the dynamic display and processing of data (documents, homework, announcements) from the database based on the request type specified via the `type` parameter in the URL. In summary:

They manage all the dynamic functions of Announcements, Documents, and Assignments (deletion, content update, etc.); furthermore, regarding general features, they protect and validate input using SQL parameters, upload files to the `uploads` folder, handle errors by displaying appropriate messages in case of failure (e.g., file upload failure, incomplete data), and redirect to the corresponding pages (e.g., `announcementTutor.php`, `homeworkTutor.php`) after each action.

Finally, the `index.html` file ensures that the page is first redirected to `identification.php`, i.e., the login page, for user authentication.

!! To access the website:

- As a **tutor** with email `dimos@gmail.com` and password `d1234`, and a 2nd account `billytsitotas@gmail.com` with password `123`.
- As a **student** with email `petros@gmail.com` and password `12345`, and a 2nd account `george@gmail.com` with password `g123`.

!! For connecting the database and the PHP files, the database user (profile) has the following login and password:

- Server name = "webpagesdb.it.auth.gr:3306";

- username = "Maritina"
- password = "Mar12345"
- db name = "student4239"

!! The website is hosted at the following link:
